## Seed detections distribution

## Cullen and Frey graph

```
## summary statistics
## -----
## min: 0   max: 18
## median: 2
## mean: 3.7
## estimated sd: 4.756642
## estimated skewness: 1.64098
## estimated kurtosis: 5.258471
```

## Negative binomial and poisson model fits for seed detections

```
# neg binom fit
seeds.obs.fit.nb <- glmer.nb(SEEDS ~ TREATMENT + (1 | BLOCK),
                             data = seed.obs)
```

```
## boundary (singular) fit: see ?isSingular
```

```
# poisson fit
seed.obs.fit.pois <- glmer(SEEDS ~ TREATMENT + (1 | BLOCK),
                           data = seed.obs, family = poisson(link = "log"))
```

Check some assumptions (seed detection models)

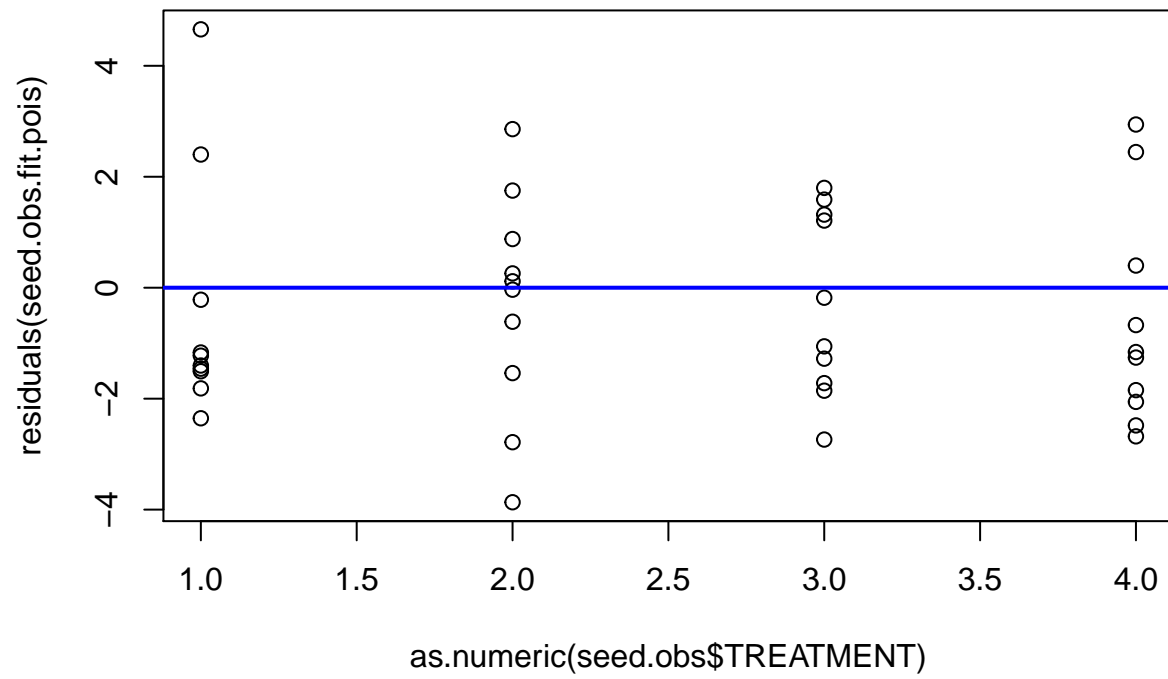

**Seed detections by treatment**

**Negative binomial residuals by treatment**

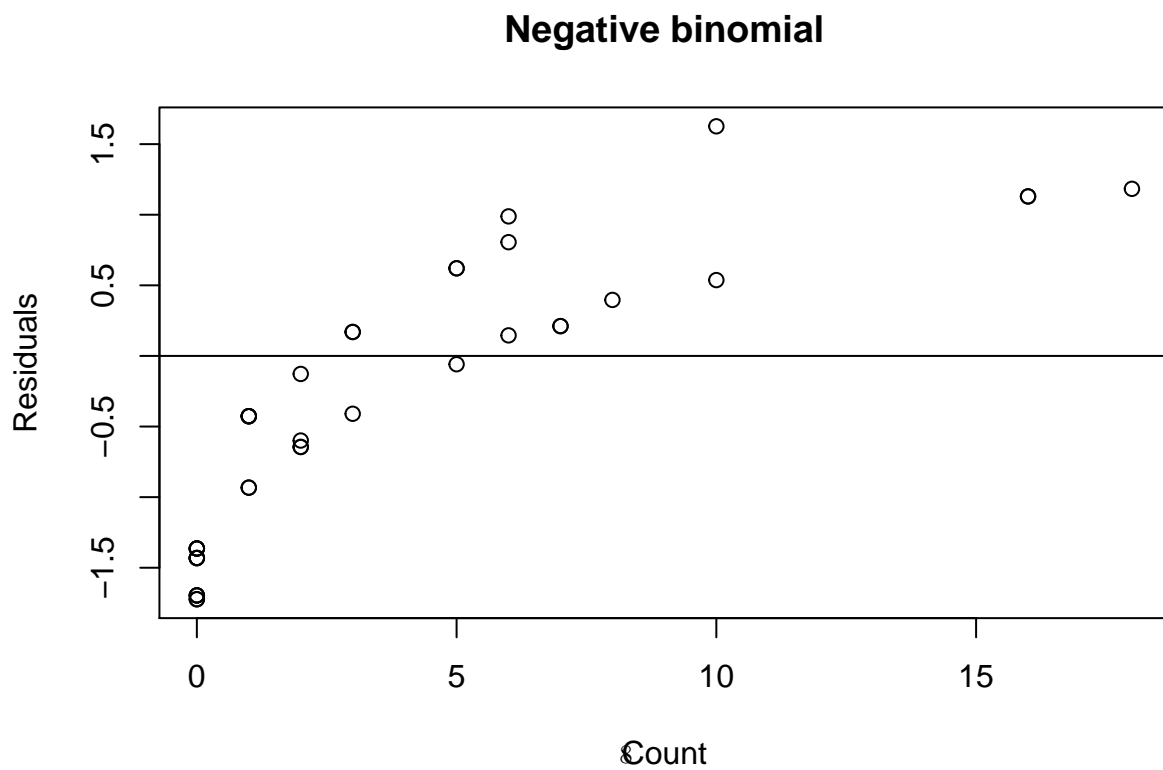

### Poisson residuals by treatment

Plot residuals from prediction to test for assumptions (seed detection models)

## Poisson

## Seed richness distribution

```
## summary statistics
## -----
## min: 0    max: 5
## median: 1
## mean: 1.5
## estimated sd: 1.484967
## estimated skewness: 0.840739
## estimated kurtosis: 2.857663
```

## Negative binomial and poisson model fits for seed richness models

```
# neg binom fit
seeds.rich.fit.nb <- glmer.nb(richness ~ treatment + (1 | sites),
                             data = seed.rich) # iteration limit reached

## Warning in theta.ml(Y, mu, weights = object@resp$weights, limit = limit, :
## iteration limit reached

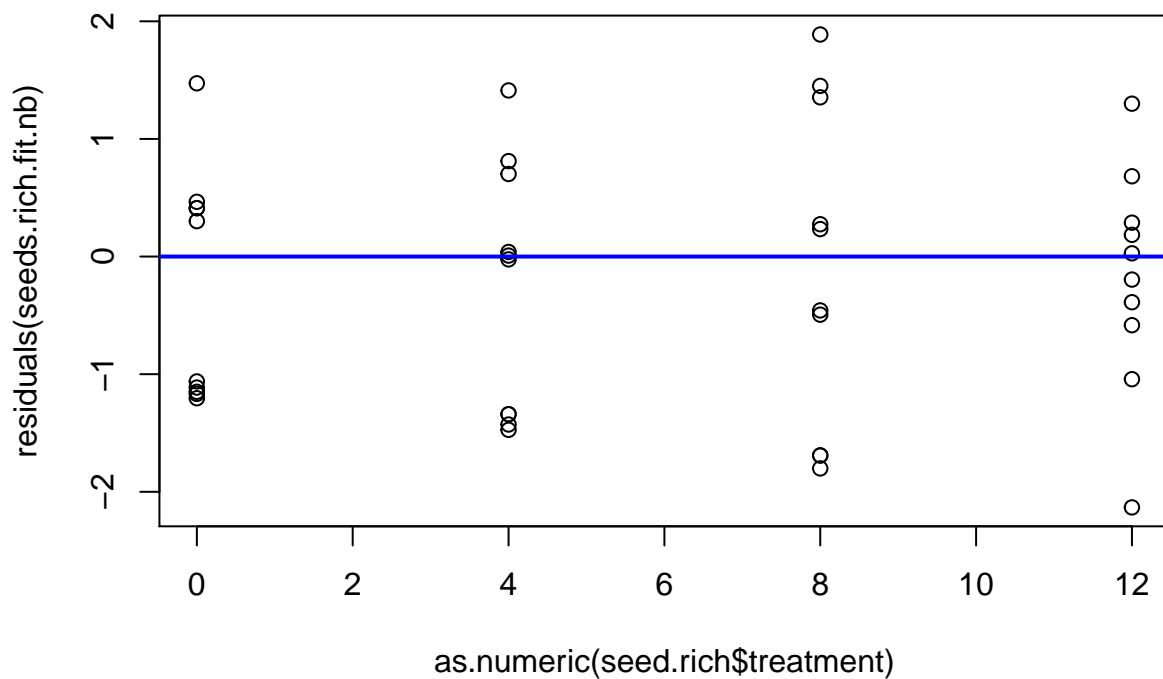

# poisson fit
seeds.rich.fit.pois <- glmer(richness ~ treatment + (1 | sites),
                             data = seed.rich, family = poisson(link = "log"))
```

Check some assumptions (seed richness models)

**Seed richness by treatment**
